

Registering all wired and wireless access points for possible e911 tracking is not only ill-advised from a cost standpoint, but also a negligible benefit to consumers and public safety. The main concern should be that WiFi phones are allowed to exist unencumbered in the market place to give consumers a real choice of providers since the dissolution of the baby bells.

The packet switched TCP/IP system confers many advantages to users of the service, one of those is interoperability. If this tenet is not preserved through the absence of legislation, then the true potential of this communication paradigm may never be realized.

Summary:

Do not require location fixing technology for all wireless access points

Reasoning:

This is counter-productive and inhibits free markets
